

Blast information verses EMP comments by Henry:

Per Jim's recent email in part.... "but it could be a template for EMP type detonation.

*HN = yes but keep in mind we are **not concerned with blast**, only high yield energy yields within the far upper regions of the earth's atmosphere. We would not receive much (if any blast effects) and a limited amount of radiation because of the height of the blast (**hob**) in the math. The high gamma ray concentration is designed to create a chain reaction of events that end up as **a lot of EMP that may well cover many states**.
E.g. it is not a blast that will knock down buildings or hurt people in the short run.*

Jim.... I was just on a phone call with Dr. Pry and he mentioned his book, **Electronic Armageddon**" has some math on the outer edges of an EMP blast.

HN = not seen yet.

Jim ... But, he cautioned that the earth's magnetic field has an impact on this and to look at the "Smiley" pattern. *HN = we need more information on air density and the smiley pattern. We need more technical inputs such as from the Huntsville NASA engineering group.*

Jim ... He also said he knows people who are working on this topic.

HN = we need to TRY to coordinate efforts with these types of technical folks. Who are the mystery folks.

<http://nuclearsecrecy.com/nukemap/>

HN = this is the type of do it your self-information that Lester was talking about within the Tuesday meeting. And yes in that this type of map/diagram with variable inputs to the MATH would give a reasonable explanation to the public on the RESULTS of an EMP event HIGH over a location such as the Capital City of that state.

New item per Jim in today's email

<http://www.hamqsl.com/solar.html>, The author of this site has solar banners that can be used on other websites (like ours) as long as proper credit and a hyperlink are used. Since there is data relating to solar and CME's

HN = I agree with the many fresh comments listed a response to Jim's request.
